

Camera Movement Protocol

If you only want to temporarily move the camera out of the way and are on a plot where you can **safely** pick up the whole construction:

1. Take a picture that you can use as a reference when reinstalling!
2. Lower the crossbeam to its lowest setting!

The crossbeam is heavy. Be careful when loosening the tripod's bolts and make sure to lower the crossbeam slowly and safely.

After the crossbeam is lowered completely, make sure to tighten all the bolts again, so that the crossbeam won't move when you pick up the tripod!

3. Detach the guy ropes from the tripod.
4. Pick up the tripod and move it out of the way!
5. Once you are done, move everything back to its place.

Remember to tighten all the bolts, reattach and pull tight all the guy ropes, and make sure the crossbeam is positioned correctly so that the camera is returned to its place above the target branch and the solar panel is facing south.

6. Notify Sophia Just which camera has been moved.

If you cannot safely pick up the whole tripod:

- 2 a) Instead of tightening the crossbeam on the lowest setting, you can remove the crossbeam completely: Move it to the lowest setting, plug out the camera and solar panel, and then lift it out of the tripod. Now carefully lay it on the ground, making sure the solar panel and camera are not damaged.

Do not attempt this alone!
